Nasal or saliva sample and buffer are added to the test well. Any SARS-CoV-2 antigens contained in the sample will start to flow down the strip.

Polyclonal control antibodies to detect gold-tagged anti-SARS-CoV-2 antibody. Shows validity of the test.

SARS-CoV-2 antigen

Gold-tagged anti-SARS-CoV-2 antibody. Pre-set on conjugate pad to form a complex with SARS-CoV-2 antigen in sample

Anti-SARS-CoV-2 antibody to detect antigen-antibody complexes

Anti-SARS-CoV-2 control antibodies bind to the control antibodies to show that all portions of the test worked correctly

Directional flow of test

Antigen-antibody complexes bind to the anti-SARS-CoV-2 antibodies at the test line, creating a color change

Excess antigens, tagged antibodies, and buffer finally reach absorption pad
